Synochopyruvate hydratase (EC 4.2.1.11) - Synechocystis sp. (strain PCC 6803)

N,Alternate names: protein s1r0752

C;Species: Synechocystis sp.
A;Variety: PCC 6803

C;Accession: S76837

C;Accession: S76837

R;Kaneko, T: Sarb. So; Kotani, H.; Tanaka, A.; Asamizu, E.; Nakamura, Y.; Miyajima, N.;
O; K.; Okumura, S.; Shimpo, S.; Takeuchi, C.; Wada, T.; Watanabe, A.; Yamada, M.; Yasuda
DNA Res. 3, 109-136, 1996

A;Title: Sequence analysis of the genome of the unicellular cyanobacterium Synechocystis
A;Reference number: S74322; MUID:97061201; PMID:8905231

A;Refatus: nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Residues: 1-432 cKAN>
A;Residues: 1-432 cKAN>
A;Rote: the nucleotide sequence was submitted to the EMBL Data Library, June 1996

CATALYTIC ACTIVITY: Cleavage of the beta-1,4-glycosidic bond between N-acetylmuramic acid and N-acetylglucosamine residues, thereby conserving the energy in a newly synthesized 1,6-anhydrobond in the muramic acid residue.
SUBCELLULAR LOCATION: Periplasmic (Potential).
SIMILARITY: Belongs to the transglycosylase slt family.
                                                                                                                    Gammaproteobacteria; Pasteurellales;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LYTIC MUREIN

-!- FUNCTION: Involved in nuclear migration during development and thereafter. Not required for centrosome attachment to the nucleus. Probably recruited to the nuclear membrane by unc-84. May participate to nuclear migration via its interaction with unc-84, which possibly disrupts the interaction between unc-84 and anc-1 and therefore frees the nucleus form the cytoskeleton and allows the nuclear migration to proceed.

-!- SUBCELLULAR LOCATION: Type IV membrane protein (Potential). The transmembrane domain associates with the nuclear envelope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Name=c;

Revolution of the enterobacterial sula gene: a component of the SOS

System encoding an inhibitor of cell division.";

Gene 52:31-40(1987).

Gene 52:31-40(1987).

-!- FUNCTION: SULA IS A COMPONENT OF THE SOS SYSTEM AND AN INHIBITOR

CELL DIVISION AND THE APPEARANCE OF LONG, NON-SEPTATE FILAMENTS.

THE EXPRESSION OF SULA IS REPRESSED BY LEXA PROTEIN. FTSZ SEEMS

TO BE THE TARGET OF SULA.

-!- SUBCELLULAR LOCATION: Inner membrane.

C. -!- MISCELLANEOUS: THE N-TERMINUS OF SULA PROTEIN MIGHT BE INVOLVED IN

RECOGNIZING THE CELL DIVISION APPARATUS.

-!- SIMILARITY: THE C-TERMINUS SHOWS SIMILARITY TO THE N PROTEIN OF

- J. SUBCELLULAR LOCATION: Secreted.

- J. SUBCELLULAR LOCATION: Secreted.

- J. PTM: Pre-sGP is N-glycosylated. This precursor is processed into mature sGP and delta-peptide by the host furin. Both cleavage fragments contain sialic acid, but only the delta-peptide is O-glycosylated (By similarity).

- J. RNA EDITING: Modified positions=295; Note=Partially edited. RNA editing at this position consists of an insertion of one adenine nucleotide (By similarity). The sequence displayed here is the small secreted glycoprotein, derived from the edited RNA. The unedited RNA gives rise to the full-length transmembrane

C -!- SIMILARITY: Belongs to the filloviruses glycoprotein family.

Sanchez A., Trappier S.G., Mahy B.W., Peters C.J., Nichol S.T.;
The virion glycoproteins of Ebola viruses are encoded in two reading frames and are expressed through transcriptional editing.";

I Proc. Natl. Acad. Sci. U.S.A. 93:3602-3607(1996).

-!- SUBCELLULAR LOCATION: Secreted.

-!- RNA EDITING: Modified positions consists of an insertion of one adenine nucleotide. The sequence displayed here is the small secreted glycoprotein, derived from the edited RNA. The unedited RNA gives rise to the full-length transmembrane glycoprotein family.

-!- SIMILARITY: Belongs to the filoviruses glycoprotein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

"Delta-peptide is the carboxy-terminal cleavage fragment of the nonstructural small glycoprotein sGP of Ebola virus.";
Virology 265:164-171(1999).
-!- SUBCELLULAR LOCATION: Secreted.
-!- PTM: Pre-sGP is N-glycosylated.
-!- PTM: Pre-sGP is N-glycosylated.
pature sGP and delta-peptide by the host furin. Both cleavage fragments contain sialic acid, but only the delta-peptide is glycosylated.
